

Survival Game Team Reflection

Member contributions:

- Anastasia Davis: Inventory system, integration debugging, architecture design
- Elena Hernandez: Version control and unity setup, day/night cycle, raycasting, environment design
- Jairus Legion: Player health, enemy AI, dialogue system, win/lose state, NPC design

What scoped well: Our plans to incorporate a wide variety of resources has a strong foundation that will allow us to easily expand the types of resources a player can find. We designed a diverse environment that can motivate players to explore various areas, each with different materials and resources. Right now we have a select amount of resource assets, but we have a straightforward process that we can use to populate the game environment with more resources a player can gather.

What overscoped: We initially started implementing a skill system in the game, but given the time constraints we only managed to get the UI working for this system. In future directions we can direct more effort in completing this system.

Integration Pain Points: We ran into several issues when trying to integrate the different systems we each were working on. Separately, our own systems functioned perfectly. However, when we tried integrating the combat system, inventory system, and teleportation system our Unity game ended up breaking. As

a result, we had to cut out the teleportation system and spend more time trying to integrate the inventory and combat systems.

What We'd Cut if We Started Over: In the event that we start over, we would cut the teleportation system because it cost us too much time trying to integrate it with the combat and inventory system. By cutting this feature, we would be able to focus on other mechanics when expanding the combat and inventory systems.
